

CASE STUDY:

Reducing High-Risk Movements by 34%

Distribution Center Decreasing High-Risk Movement with Briotix Health Wearable Technology Program

Employees at a worldwide beverage distributor were reporting discomfort associated with bending and twisting at unsafe angles. The company wanted an objective evaluation of the work tasks that included the awkward bends and a strategy to reduce the frequency of the risky movements.

Briotix Health Solution

To capture the data, Briotix Health implemented a comprehensive wearable technology solution that measured employee posture angles and repetition/duration of high-risk postures. Then using the data, a Briotix Health provider met with each employee for an individual job-coaching session to learn behavioral changes they could implement to reduce the frequency of the high-risk postures.

The program rolled out in three steps:

After evaluating the work tasks

of employees, Briotix Health

determined the appropriate

measure employee bending,

twisting, and reaching as these

wearable device needed to

were the most frequent

high-risk movements.

Device Identification

2 Baseline Testing and Pilot

Baseline testing was conducted to determine the frequency of high-risk movements, and a four-week pilot was implemented. This consisted of instant haptic feedback when unsafe postures were used and follow-up job coaching with a Briotix Health biomechanics expert.

3 Data Analysis

Upon the completion of the pilot program, Briotix Health compared pilot data to the baseline data. Significant improvement and reduction of high-risk position, duration, and frequency was seen.

Results

The pilot resulted in a 34% decrease in unsafe body angles and postures. *If the program was expanded to 12 months, this would result in 9,500 fewer high-risk postures per worker, per year.*

Future planned applications include:

- Distribution of task support to the highest risk individuals and locations
- Identification of employees in need of observation, education, and movement training
- Creation of standards on work volume or route organization
