

## RELEASE NOTES

# ICD-10 and CPT Codes

## Summary

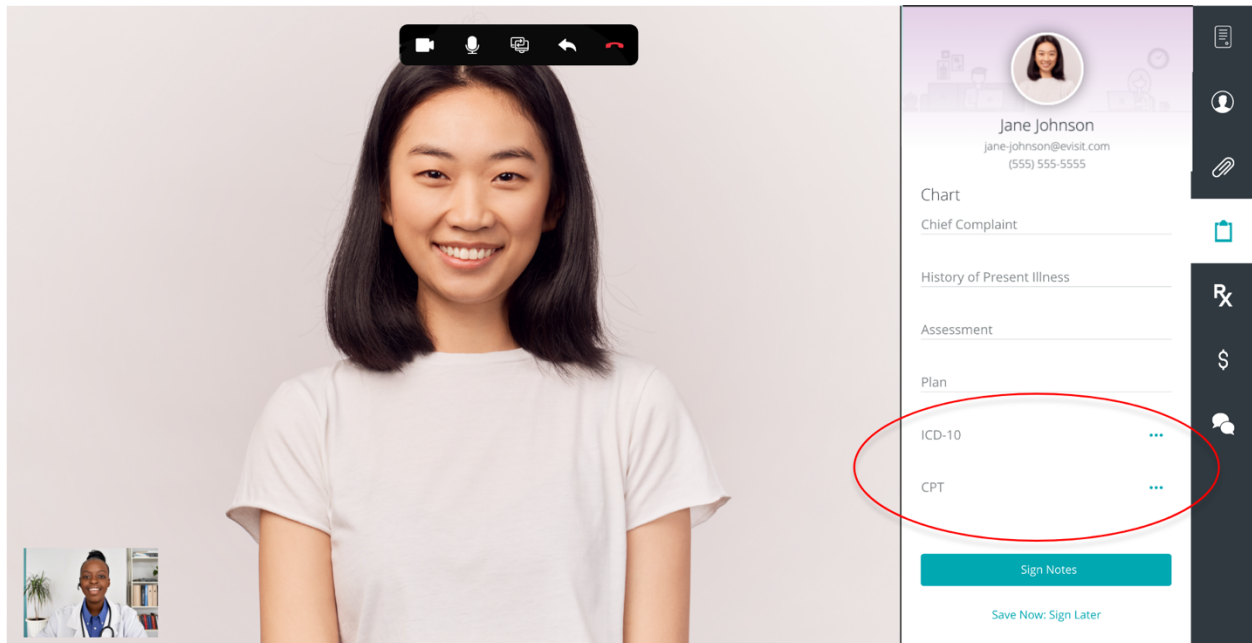

Accurate charting is the basis of delivering safe care to patients and eVisit is excited to announce expanded charting features. eVisit will now natively support ICD-10 and CPT code numbers and names, which are auto-populated within the charting feature, eliminating a previously manual process. This new feature is available both during and after the visit - on desktop and now mobile - and helps ensure accuracy in diagnosis and trust in prescribed treatments which enhance patient data and outcomes.

## Problems Solved

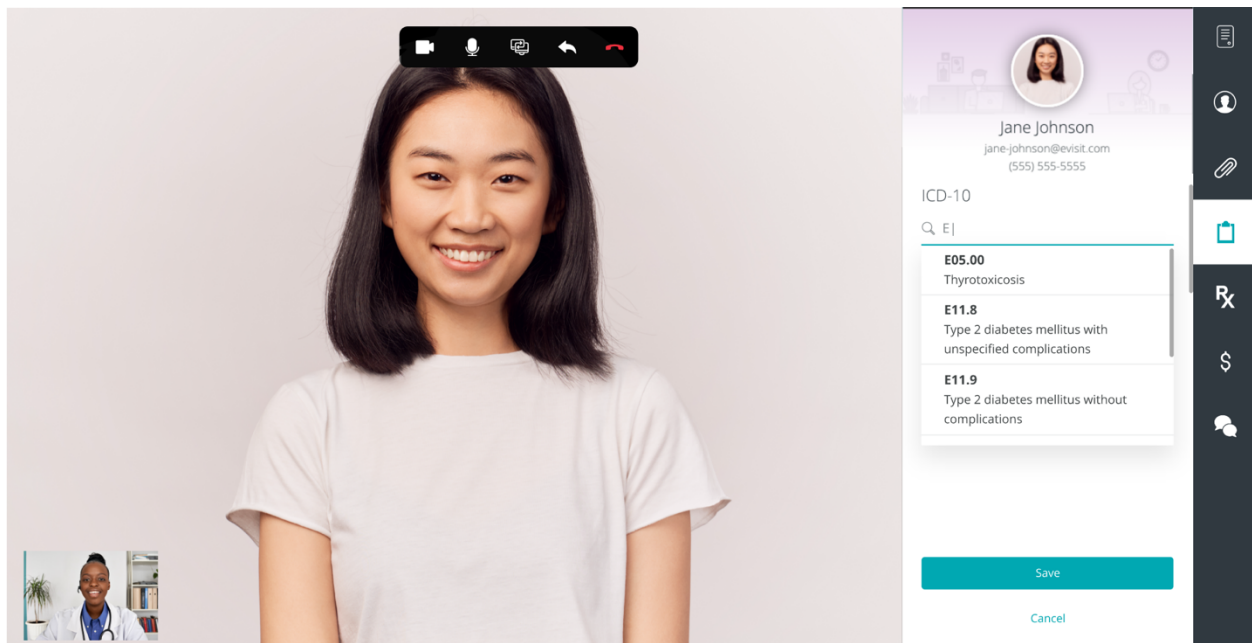

- Manually configuring a subset of ICD-10 and CPT codes
- Insufficient subset list of codes that needed to be memorized in order to be used during a visit
- Inefficient method to track and monitor diagnoses and procedures
- Inefficient method to submit billing and claims based on manually entered codes
- ICD-10 and CPT codes not being explicitly identified in Patient Visit Summary report
- Only being able to use charting after a visit is finished on mobile

# Feature Overview

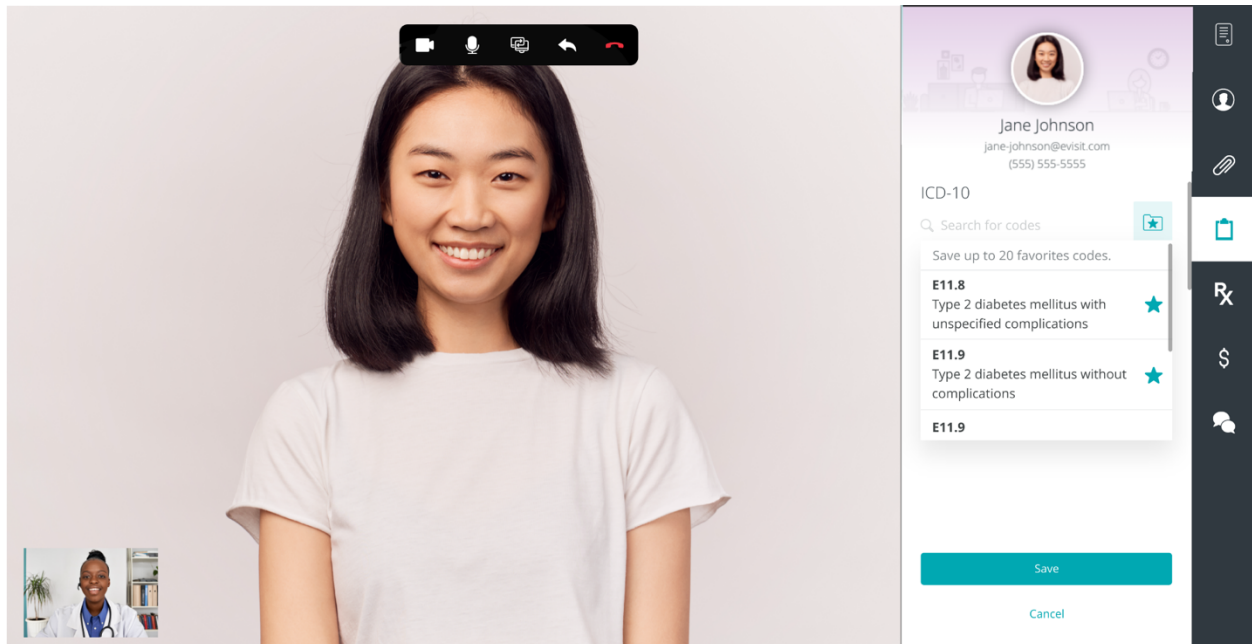

Once enabled, codes will appear in the Chart Questions section of the practice.

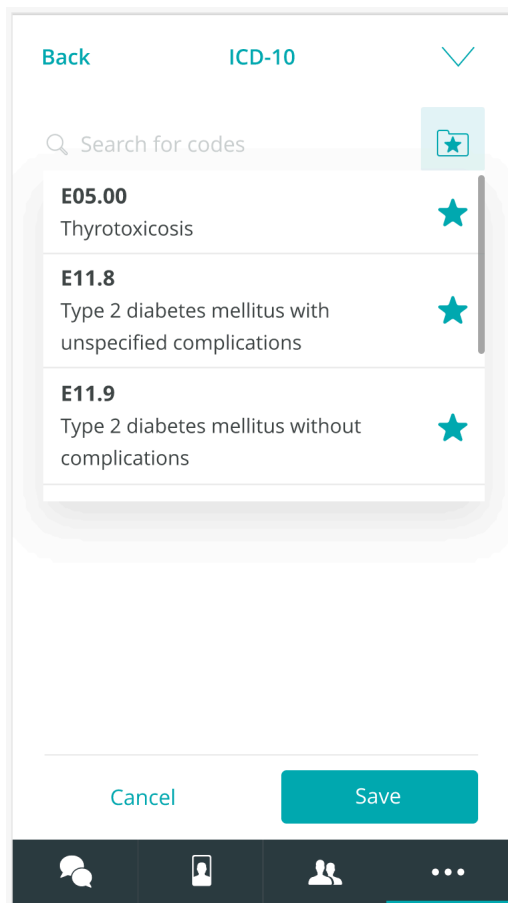

ICD-10 and CPT codes will each be a separate section within the Charting feature.

Codes can be searched by code numbers and names.

Frequently used codes can be favorited during a visit for quicker selection during future visits. Favorited codes will have their own folder for quicker selection.

This feature will enable Charting to be used on mobile during visits.

ICD-10 and CPT codes can be added to the Patient Visit Summary and can also be printed on their own PDF page

## **What you need to do**

This feature will be automatically available to any customer who has charting enabled.
