

August 9, 2021

Dear Valued Customer:

Once society and global manufacturing began the return to normal from the COVID-19 pandemic, the world's supply chains have been strained to new levels. At Everlube Products we have had minimal impact from the rebound thus far, and have been grateful. However, we are now starting to experience delivery delays in some of our key raw materials that span from our solvents and resins to the lubricating powders that our products require to manufacture. A particular concern is the availability of molybdenum disulfide. According to the manufacturer, they are experiencing production issues, which are being compounded by labor availability and logistical issues.

We are continuously working with our suppliers and raw material manufacturers to have the most current information available. We have been advised that supply of some of the raw materials will be extremely limited through early September and do not expect to be back to full production until late 2021 to early 2022. Given the limited supply, we will do our best to provide accurate lead times, but in some cases, it will be difficult if not impossible to provide. Potentially, we may have no choice but to limit order sizes in order to service as many existing customers as possible. Please note that not all of our products are affected and the most up-to-date information can be attained by contacting our customer service department.

We appreciate your understanding and patience as we sort through these supply chain interruptions.

Best Regards,

Charles J. Beall
