HOW TO READ THIS DOCUMENT

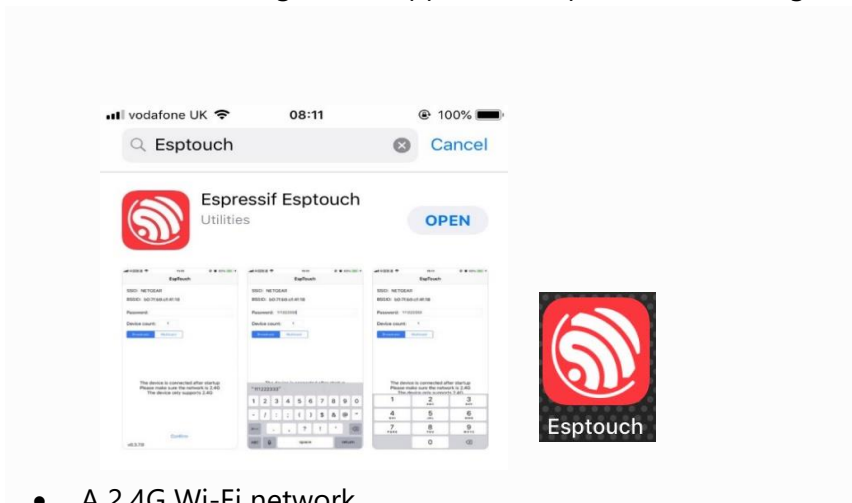

This document is intended for owners of standard arbn well installations and Arc starter kits. It describes how to connect your arbn well kit to a WiFi network. The guidelines described here should be followed as closely as practical. While arbnco maintains these documents with care and regularly updates them with the newest information, errors and misunderstandings can occur. If you are unclear about anything described in this document or need any other help with your arbn well system, please email well-support@arbnco.com. The guidelines in this document are not intended to be part of a professional code of practice, codes, standards, or statutory requirements. Happy sensing!

BEFORE STARTING

NETWORK REQUIREMENTS AND APP

To configure your Arc starter kit for your Wi-Fi, you will need the following:

- An Apple or Android smart phone.
- The Wi-Fi configuration application *Esptouch* from Google Play or Apple's App Store.

- A 2.4G Wi-Fi network

RESETTING THE WI-FI CHIP

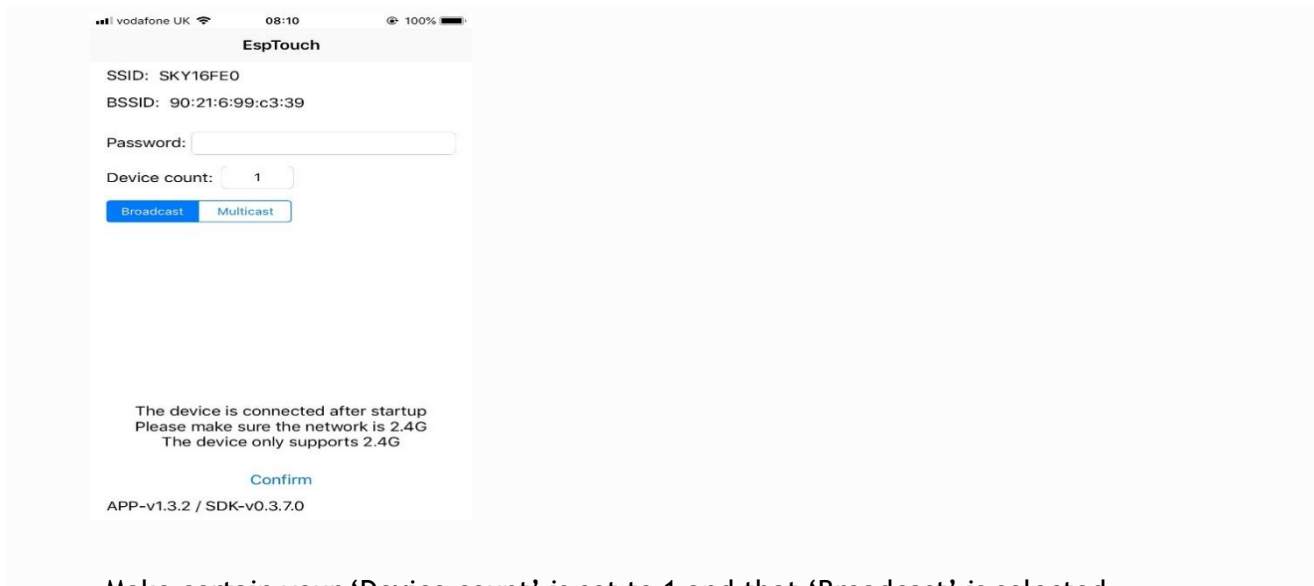

Before configuration, reset the Wi-Fi chip on each of your AQ+ devices as follows:

- Connect the device to a power source using a micro USB cable.
- Press the button on the device four times (short presses). The device's front LED will flash red and green.
- Press two more times (short presses). The device's front LEDs will flash green several times, eventually stopping on their own.

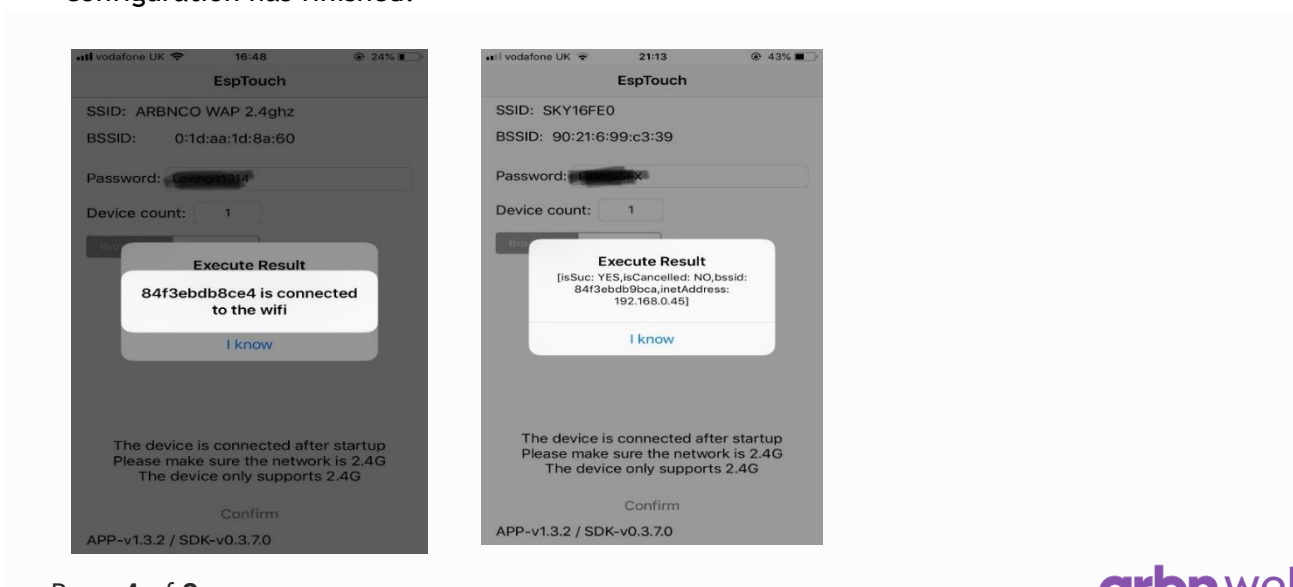

CONFIGURATION STEPS (SINGLE DEVICE)

You can either configure multiple devices together (see below) or you can configure each device separately using the following steps:

- Connect your phone to a 2.4G Wi-Fi network.
- Connect the AQ+ device to a power source using a micro USB cable.
- Open the Esptouch app and enter the password of the same 2.4G Wi-Fi network to which your phone is connected.

- Make certain your 'Device count' is set to 1 and that 'Broadcast' is selected.
- Press 'Confirm' on the Esptouch app and verify the light on your AQ+ device is flashing green, indicating it has entered acceptance mode.
- Keep the Esptouch app open for a few minutes while it is broadcasting to ensure your AQ+ device has connected to the Wi-Fi. You will receive the following messages when the configuration has finished:

CONFIGURATION STEPS (SINGLE (CONT.))

- The AQ+ device has now been configured to the Wi-Fi and you should start seeing it reporting to the arbn well platform within 60 minutes.
- You can now repeat this process with your other AQ+ devices.
- If you have purchased other arbn well devices with your Arc starter kit, these should also start reporting once at least one AQ+ device is connected. Make sure they are in the vicinity of the device, and not in sleep/shipping mode. To check whether a non-WiFi device (which are battery-powered) is in sleep mode, press the button once (short press). The LED on the front of the device should flash green.
- Once each device has reported at least once, you may begin deploying them.

CONFIGURATION STEPS (MULTIPLE DEVICES)

To configure several AQ+ devices simultaneously, use the steps below. Occasionally, this process is less reliable than configuring each device individually.

- Connect your phone to a 2.4G Wi-Fi network.
- Connect all your AQ+ devices to a power source using micro USB cables.
- Open the Esptouch app and enter the 2.4G Wi-Fi network password.

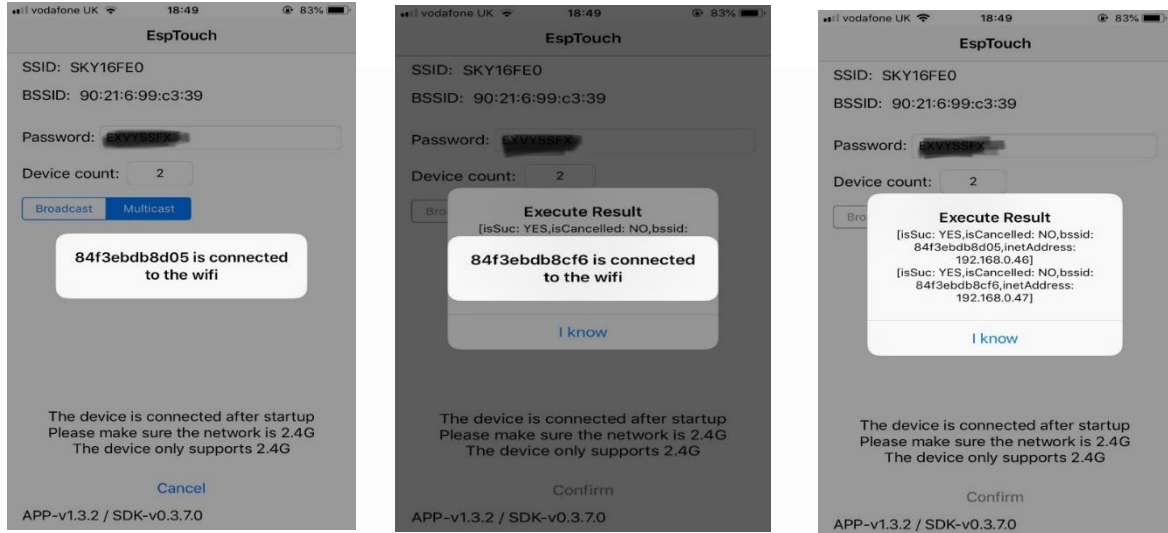

The device is connected after startup
Please make sure the network is 2.4G
The device only supports 2.4G

[Confirm](#)

APP-v1.3.2 / SDK-v0.3.7.0

- Make certain your 'Device count' is set to the number of AQ+ devices that you want to connect and that 'Multicast' is selected.
- Press 'Confirm' on the Esptouch app and verify the lights on your AQ+ devices are flashing green, indicating they have entered acceptance mode.
- Keep the Esptouch app open for a few minutes while it is multicasting to ensure your AQ+ devices have connected to the Wi-Fi. You will receive the following messages when the configurations have finished:

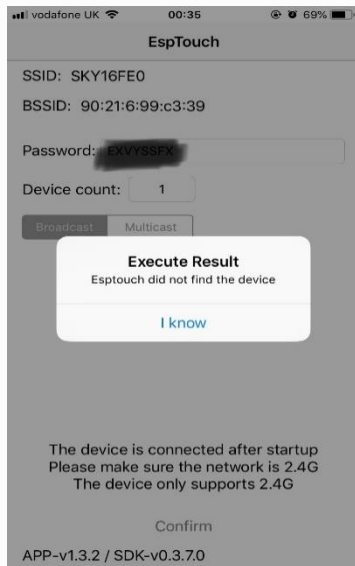

CONFIGURATION STEPS (MULTIPLE (CONT.))

- Your AQ+ devices have now been configured to the Wi-Fi and you should start seeing all of them reporting to the arbn well platform within 60 minutes.
- If you have purchased other arbn well devices with your Arc starter kit, these should also start reporting once at least one AQ+ device is connected. Make sure they are in the vicinity of the device, and not in sleep/shipping mode. To check whether a non-WiFi device (which are battery-powered) is in sleep mode, press the button once (short press). The LED on the front of the device should flash green.
- Once each device has reported at least once, you may begin deploying them.

TROUBLESHOOTING

If the Wi-Fi configuration fails, you will receive the following error:

In this case, please follow the **General troubleshooting Steps** outlined below.

If you have encountered this error while trying to configure multiple AQ+ devices simultaneously, please disconnect all but one of your Wi-Fi enabled AQ+ devices and follow the **General troubleshooting Steps** for each device individually

GENERAL TROUBLESHOOTING STEPS

- Ensure that the AQ+ device has not already connected to a Wi-Fi network by checking if your sensor device(s) are reporting to the arbn well platform. Make sure the AQ+ devices have been plugged in to power and connected for 10-30 minutes to allow the readings to propagate through the cloud. If no readings show up on the platform, carry out the following steps.
- Disconnect your AQ+ device from the power source.
- Close the Esptouch app. and disconnect your phone from the 2.4G Wi-Fi.
- Ensure that the Wi-Fi network with which you are connecting is truly 2.4G and reconnect your phone if it is (if it is not, select a different Wi-Fi that you know is 2.4G).
- Reconnect your AQ+ device to power.
- Open the Esptouch app. and follow the **Configuration Steps (Single)**.
- Repeat this process for all your AQ+ devices.
