

# FRAMING THE FACTS

## Managing Armory Assets Before IoT

Sometimes a personal touch can be beneficial, but when it comes to managing armory assets, here are five truths too hard to ignore. It's time to face the facts about manual asset management practices in public safety and discover why many departments are looking for an asset management and IoT solution.

More than **249,500 firearms** were reported lost or stolen in 2016 alone – **only 32% of assets are recovered.**

**Over 1.9 million weapons** were reported stolen in the U.S. within the past 10 years.

In 2018, a missing police handgun was **found in the middle of a city street** by an 11-year-old child, while a local fisherman recovered another weapon.

On average, police officers are issued **over \$3,500 worth of personal equipment** each shift. With manual tracking, human-error can cost departments thousands in budget resources.

Time spent conducting barrel counts and issuing weapons is **up to 50% longer** before integrating IoT technology and enterprise asset management software.
