# 3-GIS

The foundation for digital transformation
Six pillars you need to build it

Anytime, anywhere access
Expedite deployment and accelerate communication with a cloud-based architecture. Enable mobility. Decrease complexity, maintenance, and cost of ownership. Facilitate scalability.

Geospatial awareness
Precise mapping of network infrastructure. Features inherit information directly from the map. Develop a common operating picture of your assets. Visualize and better understand your whole network.

A to Z visibility
Ensure all connected network elements are modeled accurately. Prevent error introduction. Increase flexibility. Reduce waste. Enable faster outage detection and restoration when tragedy strikes.

Enterprise data
Constantly improve with time. Mitigate the risk of breaking relationships. Access records easily. Create a network knowledgebase. Establish a system of truth. Promote stronger data integrity.

Adaptable data model
Quickly make decisions and operate more efficiently. Integrate with provisioning, surveillance, outage management, and dispatch. Inform all operational components of providing service with the same truth.

Ready-set usability
Keep it simple. Encourage and facilitate adoption across the business. Design and implement organization specific workflows. Configuration not customization.
