

**MISSION
ACCOMPLISHED**

More effective management requires access to the right data.

Wasmer's process expertise helped Metalsa Structural Products Inc. meet strategic lean objectives.

"I have been working on
bringing this initiative to fruition
for three years.

By blending it with another
lean process improvement,
we were able to get it done."

- Matt Jones, Electrical Project Coordinator

SITUATION

Metalsa Structural Products, Inc. is a motor vehicle parts manufacturer in Owensboro, KY. The facility had an initiative to identify and eliminate waste in their facility. They started in the right place with their utility bills, but found that separating expenses between production costs and overhead costs was not a simple task with their current systems. They wanted to better understand their costs so that it was easier to identify waste.

SOLUTION

The Wasmer Company was brought in to help design and implement a cost segregation program by production line in their facility. The future capabilities of this program will collect and relay data back to operators so that they can make adjustments as necessary. The program will create a commodity cost breakdown per widget created, allowing Metalsa to run a leaner operation at their Owensboro facility.

The energy dashboard created by the Wasmer Company and the software collecting the data is capable of scaling for future project objectives. It shows a realtime view of data via the web, VNC, and panel view.
