

Safer weighting solution

Fill with small diameter (6 to 10mm) smooth pea gravel. This allows for easy filling, water drainage, and long bag life. Use end to end on the edges and along seams. Put a double row of Gravel Bags along the top front edge of the silo during feed-out. When filled, the bag holds 17kg of pea gravel.

Silostop Gravel bags are supplied with the following features:

- » Tie string
- » Grab handle
- » Fill-level-line
- » Application guide

Silostop Gravel bags offer a convenient and effective solution for sealing silage bunkers and piles. Once filled, their shape ensures that covers are held securely in place. Use Silostop Gravel bags instead of tyres, which can be the cause of wire disease in livestock. Gravel bags should be placed around the perimeter, with a double layer on the front edge and along seams.

BENEFITS

- Eliminate tyres for an easier, safer, more environmentally friendly weighting solution.
- Robust woven netting material with a lifespan of at least five years.
- Oblong shape ensures the maximum sealing effectiveness when laid along seams and edges.
- Quick and easy to move as silage is taken from the face.
- Pallet storage is simple and tidy.
