

# Vaccine Rollout Case Study

---

## Tracking Vaccination Data

When the COVID-19 pandemic began, senior living facilities such as Atria Senior Living were particularly susceptible to infection because of the relatively closed community structure and the health concerns of their residents. The announcement that the vaccine was available to the public was welcome news, but it also posed a complex new problem — how to schedule, administer, and track vaccines across facilities, portfolios, and states. Many senior living communities struggled to log all vaccine-related records quickly and properly. That old paper-based systems proved to be particularly inadequate to this massive new organizational project and presented an opportunity to make the Glennis Senior Living software suite even more useful.

## The Vaccine Tracker

Some of the leading minds in senior care laid the foundation for what would become a critical feature of the Glennis Care module: Vaccine Tracker, a mobile-enabled tool that displays the required number of vaccines for every illness, records which residents decline vaccination, sends reminders when vaccinations are due, and logs when those vaccinations are administered. A dashboard visualizes an overview of vaccination data, with the functionality to filter down to the resident level. Because data is integrated into the Glennis Care module, reminders and task assignments automatically generate for staff members so they can stay on top of all the steps required to preserve the health of those in their care.

“This past year as we all have navigated the pandemic, I am grateful for the tools that I have available at the click of a button,” said Jen Johnson, National Director of Care. “I can click into the Vaccine Tracker and see where a community is at in the vaccination process for both residents and employees. You can also see the total vaccines given, broken down by residents, staff, visitors, and vendors. Being able to sort all this information saves time and facilitates follow up.”

## Taking Action

The Glennis Vaccine Tracker was used to successfully schedule and track vaccinations across the Atria portfolio in every state as soon as they became available. To date, Glennis has ...

Logged more than 10 million temperature readings.

Collected and tracked the vaccination data for more than 35,000 individuals and more than 50,000 doses (including more than 20,000 residents).

Given medical supervisors and company management the ability to recognize, track, and take action against the spread of any contagion from the facility level to the entire portfolio.

December 21st, 2020, Atria Springdale resident receiving her first COVID-19 vaccine.
