

The falling light

This design intends to capture the light through the most sophisticated technology and embody its quality. The design begins with a rough stone block, where the sunlight cuts in and passes through freely.

The optical fiber embedded in the stone transmits sunlight and lightens the bottom surface. For the viewers from a distance, they can see many beams of sunlight in the haze. When they move closely, clusters of light in the stone appear. When they enter the tower, they are crowded by starry lights. The tower absorbs sunlight during the day, and emits light at night.
