

The idea of the tower was based on the idea of a tower in the form of a tree. The competition aims not only to show respect for the environment and ecology, but also to solve the problem.

These were two towers, as symbols of the west and east coast. The idea is to ensure mutual understanding, world-class communication, respect for the environment, Green Arena, unique lighting and multi-functional leisure space that allows you to accumulate activities in the park.

In addition to the main towers, four solar stations have been designed that accumulate and transmit electricity. This will allow the use of zero-cycle energy and the sale of surplus electricity, while the stations themselves at that time will become both observation zones and smoking areas.

The tower space is divided into types and blocks of functional use. Solar panels are installed on the tops of both towers, and the two upper floors are given over to observation platforms. Below are the spaces divided into blocks, where each of them has 3 floors of space of a certain nature. Thus, on the territory of the western tower, there is a three-story view restaurant, a night club, alleys for exhibitions and fairs, and on the territory of the eastern tower there is an area of agricultural events and a place for selling seedlings. Also, the towers are bounded in diameter by two belts, which are glazed with ordinary glass on the north side, and solar panels on the south. This allows you to increase energy collection and get closer to the energy-producing cycle.

In artificial lighting for night time, only green spectrum light and a short wavelength are used. Along the entire perimeter of the park is meant the location of motion sensors to which the source of artificial lighting will respond. Above, the lighting elements are overlapped by the crowns of trees, thereby not letting out artificial light in the open air. This allows you to reduce the effect of artificial lighting in the park and at the same time create an atmospheric image of the night Arena green subordinate to the main elements of the composition of the towers-trees.
