

The project consist in a series of waves made of arches of a mixed structure of reinforced concrete that gives way to a space frame that's covered with concrete plates on the outer side and aluminum plates ones on the inner one. Portions of the structure are accessible by walk and climbing and platforms allow for exceptional views. Others portions are just inaccessible by design and support either vegetation or solar panels for powering the lights. Lights can work either with batteries charged during the day or by just "selling" power to the city and buying it back at night.
