

Green Valley

Like the transistor was invented and San Jose became Silicon Valley, here is Green Valley where its own energy production and greenery make harmony.

Artificial photosynthesis using solar panels produces its own energy. The park provides an experiential space of light, water and plants.

Visitors can ascend naturally up the promenade through a huge ramp at the entrance and in the middle. The ramp at the entrance has a circular water plaza.

The plaza has water on a transparent circular board. And visitors can see the sky from the plaza beneath the board. At this moment the shadow of the water is created inside the square, and visitors will experience the view of the sky from the water.

From the aerial promenade, you can enjoy a walk at the eye level with the trees and see all the views of the park. The pillars of the aerial walkway are perforated walls and the surface is covered with plants. It is also connected to the light through the hole in the wall..

It is a huge waterfall located in the center of the park, and people can go through the waterfall. And there is a huge ramp surrounding the revelation. Another square in a dome-shaped structure has water and sculptures. This space becomes an object that harmonizes the shadow of light generated by the structure with water.

The tennis court across the river was inserted 1.5 meters into the ground. Then go up the huge ramp next to the water and there is a circular net floating on the water. Visitors will sit here and experience floating on the water.
