

The change of Interaction

Silicon valley and San Jose especially are the home of the digital information revolution that has become the major society shifting in new millenia. Our intention of creating this monument is based on the very base idea of digital revolution : the change of understanding human interaction and engagement.

We create a connecting bridge between east and west, to create a 1.000 feet long monument. The bridge itself consists of 2 forms, the base form and its reflection as a sculptural tube. We are considering the use of inward lighting and the monument form itself not to be confused with the aviation signal, and also protecting the light-sensitive animal. In this sculptural tube are the functions of urban farming and sky forest that meant to become a main place of human interaction to its environment. To reduce the need of energy we also located a solar panel energy generator to be used as a secondary power source for lighting attraction. We create a historical museum of Indian and Spanish history that is located at the very end of the bridge. This museum also functions as a load bearer for bridge structures.
