

The Optic Bubble is a bold synergy of art and engineering. It will provide a significant visual presence and identity for the city of San Jose, a new inclusive community space full of nature and culture, plus 360 degree views of the city. The ethereal presence of the skin will radiate with light as the sun arcs across the valley, appearing to melt away and disappear as the sun sets behind. Running on solar energy with the excess stored and distributed in the form of hydrogen, over time the Bubble will become a carbon positive enterprise.
