

Voids

form - derived from the concept of cloud data that is related to the human data age. The space in which the current data is displayed in this way. The data is in the form of horizontal void in a vertical void that is metaphorically considered as a cloud-like space.

Function - The modern age of data in the face of this phenomenon, which is changing more and more every day under the influence of it, needs to create a balance to prevent the damage caused by this phenomenon. The loneliness of modern man is one of the most obvious destructive effects of this age. On the other hand, according to some theorists in the field of physics, the expansion of this new era will lead to the creation of a new species in the future, so that data collection can be intelligent inventory. If this living organ is able to recognize existing abnormalities and be able to define ways to deal with it, an organ with a defense mechanism is recognized. Recognizing the damage caused by data on humans is the task of the defense mechanism of this creature. Creating a collective space with new features to exchange and satisfy new human needs in this project as defined and proposed functions at the beginning of a revolution that is growing stronger.

Material - Vertical void is made of transparent concrete, which can provide the energy required by the set by placing energy-absorbing technologies according to its significant surface.

Horizontal voids in the outer part is made of composite sheets and in the inner part is made of the silicone veneers that are stretched on the mechanical arms, which at the same time, due to its elasticity to create the desired functions, can find meaning with its adjacent site, Silicon Valley.
