

Project Summary

The “Pulse of San Jose” aims to provide an unforgettable icon for the San Jose region. The design mimics the likeness of a pulse which ties into the liveliness of the region. In addition to its striking visuals, the design incorporates a track which guests can take to view the sites and also a mini-museum/exhibition space. The proposed structural framework is fibrecarbon, thought to provide rigidity and lightness. The inner side of the structure intends to be a dia-grid programmable light surface. The outer side will incorporate solar panels and a track path for the proposed passenger capsules.
