

## ProjectStatement

The internal structure that is proposed is based on metal profiles, the skin or lining is proposed with titanium oxide sheet, the meridians are connecting elements with the entire structure, for water and vegetation drainage, as well as for ducts of lighting installations. Regarding lighting, it was only considered to be only down to avoid problems with aviation. The parallels are elements divided into two parts, the upper one for vegetation and birds nest and live, the lower part is to create multi-colored lighting, and movements along with the parallels. Parallels and meridians can function independently. The park's design is based on two points, one is the structure, the other point is a great source, from these two points it is proposed that part of the circumferences be radial and grow outside to create an alternating wave pattern. Part of the source waves form the connection of a bridge to the central plaza area. Two accesses that go to the center of the sculpture from the side streets were considered, these accesses are two supports of the sculpture to go through the doors, the third door, has access that ends at the slope of the boulevard, these three accesses represent access to the past to present and future, and are part of the silicon molecule important element in manufacturing technology in Silicone Valley. In the western part of the structure, three thicker

stripes were considered to be placed, these are the physical representation of the vibrations of the population of Silicone Valley, which are directed in a certain direction. Looking at the structure from a distance, and walking until we reach its center, we can see how its shape changes, changes that are necessary from various points of view in today's world.
