

Not a static object, not only an icon, not only a point of view, not only a space for the community, not only a tower but also a wind turbine that converts the wind's kinetic energy into electrical energy.

A sculpture and a structural object, a legacy column of the past that turns into sustainable technology. The stem is divided into portions capable of capturing the wind.

Three towers where collective spaces define a place where you can meet and recognize your community. Lanterns that light up and make energy production tangible with the desire to make the park self-sufficient.
