

GALAXY PATH

The main idea of the project comes from the stars located in the space with a totally dark background. The light boxes are located around a path and ramp similar with the stars in a scattered distribution. It does not occur in a disorganized way but with different & fluid density distributions. This galaxy path offers the occupants an open-air planetarium experience and physical activity tensioned in the research made by SPUR. The users view the cityscape from a high level of elevation and the design can be seen from distant parts of the city with a dynamic and iconic manner.
