

Project Statement

This design encompasses many things, and it is my hope a visitor will be able to develop vivid memories of the feelings it provokes. The light sculpture serves as an emblem of human capability; our strive to make the world a better place. The structure itself is meant to capture many different ideas, with some being strength, patience, and empathy. The viewing platform is the opportunity for another perspective, one of height and freedom. The lighting is planned to be adjusted on a schedule to be more considerate of times and seasons that are environmentally sensitive. The glass would also be meticulously created and positioned to deter birds. It is my hope that we can incorporate the net-zero principle into the landmark as well, perhaps with the use of solar panels. The view from atop the pyramid would be a full 360 degrees, showing off the beauty of Silicon Valley and its people. Visitors from around the world would be able to experience this unparalleled wonder and the history of the land it inhabits. It would be a place for celebration, for the harmony of nature and man. The existing amenities would also enhance the appeal of this future landmark's home. It's integral that the main attraction, however, is unique enough to set Silicon Valley apart from the rest. We won't just be creating a new building, we'll be creating a new precedent.
