

Appearing Stars

Two amorphous-shaped towers with semitransparent interactive skin and lightweighted construction elements are carriers for innovative thin film solar technology which demonstrates the future of net zero energy construction in a new way: The solar panels and the intelligent lighting elements flow together like two rivers, form a symbiosis of energy input and output and stretch over the park area. The semitransparent light membrane can be illuminated by a LED system in many different ways. The whole skin or parts of it can display various patterns, colors, videos or text messages and reacts interactively to people.
