

Project Statement

I want to present the design of my art project. This is a simple design created on the basis of a solar power plant in the shape of the number "8", which will receive energy from the sun during the day and illuminate everything around it after dark. The construction will be made with eco friendly materials and will demonstrate respect for the environment.

The design of the solar power plant is quite simple and consists of the following elements:

1. lighting unit (usually an led mounted in the housing);
2. solar battery (a photovoltaic module that converts solar energy into electricity);
3. controller (controls lighting – turns it on and off at the right time);
4. built-in battery (accumulates electricity in the daytime for its consumption at night);
5. support or mounting.

This art project will help you feel the spirit of technological talents who have changed the world and continue to change it for the better.

The design symbolizes the number eight and the infinity sign. This means that Silicon Valley will always be there, and people from all countries will strive to come here to experience this powerful spirit of high technology.

The branches coming from the art project «8» are an extension of the solar power plant and symbolize computers, microprocessors, software, mobile communications, biotechnologies, artificial intelligence etc.

The art object will be safe for the environment.
