

Project Summary.

We create a world icon by merging representative elements of the place, designing a structure that is at the same time a forest, a landscape, an observation tower, a path, a mountain and an urban lamp. Inspiration comes from the "printed circuit board," which is a surface with a network of paths that end in a point or circle. We adopted this idea because it exemplifies the objectives that must be achieved with the construction of the project, such as creating a place that can be visited, appreciating the images and associating the city of San José with technology.
