

Cloud of Steel

This project “Cloud of Steel” is based on the idea of information made visible. The Cloud is a meta-physical entity we use for storage of data. The Cloud is a romanticized idea of storage or information, but in actuality it is a data center somewhere, rather nowhere, in the desert of Nevada. Similarly, this project physically represents an intricate digital network which is the essence of Silicon Valley. Network mapping is a common term used in software engineering and hence it perfectly fits into the technological ecology of silicon valley.
