

## PROTECT PUBLIC HEALTH

With the growing body of knowledge around the harmful health effects of PFAS, it only makes sense to test in areas where PFAS contamination is likely.

# 7 Reasons to test for PFAS now

1

## AVOID NEGATIVE PUBLICITY

While it may seem prudent to wait until there is clear guidance, PFAS contamination has caught the attention of many consumer and environmental groups as well as the media.

2

## MEET REGULATORY REQUIREMENTS

While the EPA has yet to issue enforceable PFAS contamination rules, many states have issued their own guidance and/or legislation.

3

## MAKE DATA-DRIVEN DECISIONS

PFAS testing results can help put together an effective remediation plan, give appropriate guidance to the public, and ward off media-driven fear.

4

## LOWER REMEDIATION COSTS

PFAS may last forever, but most companies don't. It's easier to discharge the burden of remediation on the source of the contamination if that source is still in business.

5

6

7

## PREVENT FURTHER CONTAMINATION

It's also easier to eliminate further contamination if you know the source of the PFAS chemicals and how they are reaching the water supply or food chain.

## AVOID LEGAL ACTION

Lack of federal and state regulatory limits on PFAS chemicals does not mean municipalities are in the clear legally. Lawsuits charging PFAS pollution can be brought against the city on other grounds.
