Traumatic Grief:
Cognitive, Behavioral and Somatic Approaches

J. Eric Gentry, PhD, LMHC, DAAETS, FAAETS
J. Eric Gentry, PhD, LMHC, DAAETS, FAAETS is an internationally recognized leader in the study and treatment of traumatic stress and compassion fatigue. His Ph.D. is from Florida State University where he studied with Professor Charles Figley—a pioneer of these two fields. In 1997, he co-developed the Accelerated Recovery Program (ARP) for Compassion Fatigue—the world’s only evidence-based treatment protocol for compassion fatigue. In 1998, he introduced the Certified Compassion Fatigue Specialist Training and Compassion Fatigue Prevention & Resiliency Training. These two trainings have demonstrated treatment effectiveness for the symptoms of compassion fatigue and he published these effects in several journals. He has trained over 100,000 health professionals over the past 20 years.

Dr. Gentry was original faculty, curriculum designer and Associate Director of the Traumatology Institute at Florida State University. In 2001, he became the co-director and moved this institute to the University of South Florida where it became the International Traumatology Institute. In 2010, he began the International Association of Trauma Professionals—a training and certification body—for which he was the vice-president.

In 2005, Hogrefe and Huber published Trauma Practice: Tools for Stabilization and Recovery—a critically acclaimed text on the treatment of traumatic stress for which Dr. Gentry is a co-author. The Second Edition was released in 2010 and the Third Edition in 2015. He is also the author of the groundbreaking Forward-Facing® Trauma Therapy: Healing the Moral Wound. He is the co-author of Forward-Facing® Professional Resilience: Resolution and Prevention of Burnout, Toxic Stress and Compassion Fatigue, Unlocking the Keys to Human Resilience, and Transformative Care: A Trauma-Focused Approach to Caregiving. These books provide a new vision for trauma therapy in the 21st Century. He has written numerous chapters, papers, and peer-reviewed journal articles in the areas of traumatic stress and compassion fatigue. Dr. Gentry is a Master Traumatologist with over 35 years of clinical experience with trauma, Complex PTSD, personality disorders, and dissociation.

He is the President and CEO of The Forward-Facing® Institute and owner of Compassion Unlimited—a private psychotherapy, training, and consulting practice—in Phoenix, AZ.

Speaker Disclosure:
Financial: J. Eric Gentry receives compensation as Owner of Compassion Unlimited. He receives royalties as an author for Hogrefe & Huber Publishing. Dr. Gentry receives a speaking honorarium from PESI, Inc.
Non-financial: J. Eric Gentry has no relevant non-financial relationship to disclose.

Effectiveness and Limitations

- The first half of this presentation is simply factual peer-reviewed research on Traumatic Grief – no risks of limitations (other than there needs to be more research into the understanding of traumatic grief).
- The second half of this presentation is on Treatment of Traumatic Grief and does come with some risks and limitations:
  - The presentation reports on two systematic reviews of treatment for Traumatic Grief.
  - There has been minimal treatment development on this phenomenon, so mostly the presentation reports on adapting current treatment protocols to fit to address the treatment issues of Traumatic Grief.
— The presentation explores a model developed by Smid et al., 2015 called “Brief Eclectic Psychotherapy for Trauma Grief (BEP-TG).” About the efficacy of this model the authors state: Although BEP-TG consists of components with proven effectiveness in the treatment of PTSD, PDSD, and MDD, the efficacy of the full BEP-TG protocol in reducing symptoms of these disorders following traumatic loss remains to be established.

— The Family Resilience with Traumatic Grief developed by Özcan & Kaya in 2019 reports effectiveness data with a small N.

— A Salutogenic “Active Ingredients” Approach, developed and utilized by the presenter—while it utilizes the four primary “active ingredients/common factors” has no effectiveness or efficacy data. This method is offered as only a method for lessening distress associated with Traumatic Grief, not resolving the symptoms.

— There is not yet enough treatment data to offer “evidence-based” treatments for the condition of Traumatic Grief.

---

Risks

— Anytime a clinician is working with someone suffering symptoms of Traumatic Grief (which includes symptoms of Prolonged Complex Bereavement Disorder, Posttraumatic Stress, and Major Depressive Disorder), the treatment is fraught with risks. Each of these conditions have a high risk for intentional and accidental suicide, substance use/abuse, impulsivity, compulsivity with moderate to severe impairment.

— Any treatment protocol or process must constantly assess for safety, impairment, self-harm, and self-destructive methods of coping.

— Since exposure is an indicated and important element of reported effective treatment with TG, care should be taken to teach, coach, monitor and facilitate these exposure activities only with those who are able to remain in a down-regulated ANS to minimize the possibility of abreaction and retraumatization.

---

Traumatic Grief/Traumatic Bereavement

— Traumatic Grief [Traumatic Bereavement] usually involves the unexpected—sometimes violent or horrific—loss of a loved one.

— When people lose intimates unexpectedly, from malicious acts of violence, they are at risk for chronic grief reaction.

— Traumatic Grief is an alchemy of Persistent Complex Bereavement Disorder [PCBD] and Posttraumatic Stress Disorder [PTSD].

— In the universe of life events, traumatic loss and traumatic stress intersect a great deal, both in event dimensions and psychological impact (p. 73).

— While grief and trauma frequently intersect, grief is a distinct individual, social, and relational experience (p. 74)
Early Developments

16% of persons who suffered loss by traumatic means met DX criteria (DSM-IV) for PTSD and 22% met lifetime PTSD criteria.

The diagnostic criteria for Traumatic Grief is built around two components/constructs: Separation Distress and Traumatic Distress.

Traumatic Grief was developed from Chronic Bereavement.

Traumatic grief is 18.6% in global clinical populations.

Symptoms

**Separation Distress**
- Intrusive, distressing preoccupation with the deceased;
- Yearning, longing and pining;
- A perceptual set including visual, tactile, and auditory illusions
- Crying
- Searching for the deceased;
- Extreme loneliness

**Traumatic Distress**
- Feeling unfulfilled without the deceased;
- Avoidance of painful reminders of the loss;
- Futility about the future;
- Feeling (believing) a part of the self has died;
- Numbness and detachment;
- Shattered world view (regarding trust, security and control);
- Feeling shocked, stunned and dazed;
- Disbelief about the death;
- Emptiness;
- Taking on symptoms or harmful behaviors of the deceased;
- Bitterness

Traumatic Grief is associated with multiple physical health problems: High BP; cancer; cardiac events; ulcerative colitis; suicidality and global dysfunction.
Traumatic loss involves the loss of loved ones in the context of potentially traumatizing circumstances and is a common reported traumatic event. It may give rise to disturbed grief, called prolonged grief disorder (PGD) in ICD-11 and persistent complex bereavement disorder (PCBD) in DSM-5, combined with posttraumatic stress disorder (PTSD) and depression.

Proposed Diagnostic Criteria for Traumatic Grief

Criterion A
1. The person experienced the death of a significant other.
2. The response involves intrusive, distressing preoccupation with the deceased person (e.g., yearning, longing, or searching).

Criterion B
In response to the death, the following symptom(s) is/are marked and persistent:
1. Frequent efforts to avoid reminders of the deceased (e.g., thoughts, feelings, activities, people, places)
2. Purposelessness or feelings of futility about the future
3. Subjective sense of numbness, detachment, or absence of emotional responsiveness
4. Feeling stunned, dazed, or shocked
5. Difficulty acknowledging the death (e.g., disbelief)
6. Feeling that life is empty or meaningless
7. Difficulty imagining a fulfilling life without the deceased
8. Feeling part of oneself has died
9. Shattered worldview (e.g., lost sense of security, trust, or control)
10. Assumes symptoms or harmful behaviors of, or related to, the deceased person
11. Excessive irritability, bitterness, or anger related to the death

Criterion C
The duration of the disturbance (symptoms listed) is at least two months

Criterion D
The disturbance causes clinically significant impairment in social, occupational, or other important areas of functioning

The Traumatic Grief Inventory Self-Report Version (TGI-SR):

1. I had intrusive thoughts and images associated with his/her death.
2. I experienced intense emotional pain, suffering, or anguish of grief.
3. I felt a strong longing or yearning for the deceased.
4. I experienced difficulty in accepting the loss.
5. I avoided places, objects, or thoughts reminding me of his/her death.
6. I found it difficult to trust others.
7. I felt bitter or angry about the loss.
8. I experienced difficulty to move on with my life (e.g., pursue friendships, activities).
9. I noticed that life is meaningless or empty without the deceased.
10. I felt shocked or stunned by his/her death.
11. I had intrusive thoughts and images associated with the circumstances of his/her death.
12. I had difficulties with positive reminiscing about the deceased.
13. I had negative thoughts about myself in relation to the deceased or the death (e.g., self-blame).
14. I experienced a desire to die in order to be with the deceased.
15. I felt alone or detached from other people.
Treatment of Traumatic Grief (Early Years)

• In January 1997, a panel of experts in the areas of bereavement, trauma, and psychiatric nosology convened to discuss the need for diagnostic criteria for complicated grief, or what we now prefer to call Traumatic Grief (Prigerson et al., 1999)
• Traumatic Grief = Separation Distress + Traumatic Distress
• Resistant to interpersonal psychotherapy and tricyclic antidepressants (separation distress sx more acute and debilitating than MDD)
• Attempts to develop psychotherapeutic treatments that addressed both Separation & Traumatic Distress

What Works?

• Relationally-driven treatment
  [Feedback Informed Treatment]
• Crisis Intervention
  —Stabilization & Case Management
• Brief Dynamic Psychotherapy
  —Separation Anxiety
  —Attachment wounding
• Cognitive Behavioral Therapy
  —Perceptual distortions
  —Avoidance
• Exposure Therapy
  —Grief & Trauma both
  —In vivo or imaginal
• EMDR
• Brief Eclectic Psychotherapy for Traumatic Grief
Table 1. Hypothetical staging, profiling, and stepped care model for grief.

Boelen & Smid (2017)
Treatment Issues for Traumatic Grief

1. Inadequately integrating the memory of the traumatic loss
2. Negative appraisal of the traumatic loss
3. Sensitivity to matching triggers and new stressors
4. Attempting to avoid distress
5. Characteristics of the traumatic loss, attachments, and development
   - Ambiguity
   - Inability to understand or process the magnitude of the traumatic loss
   - Experiencing similar events, such as rituals or dreams
   - Sensitivity to environment and people
6. Cognitive processing and attachment reactions
   - Absorbed in emotional, somatic and sensory processing
   - Unable to conceptualize alternatives
   - Attachment-related automatic responses influence cognitive processing of the traumatic loss

Smid et al., 2015

Brief Eclectic Psychotherapy For Traumatic Grief

- 12 – 16 Sessions
- Integrated Protocol utilizing Cognitive, Behavioral, Somatic and Exposure Therapy
- Intentionally addresses each of the previous treatment issues

A cognitive stress model of traumatic grief provides a rationale for treatment. According to this model, processes contributing to traumatic grief include inadequately integrating the memory of the traumatic loss, attempting to avoid distress, negative appraisal of the traumatic loss, and sensitivity to matching triggers and new stressors. BEP-TG aims at elaborating and integrating memories of the traumatic loss, providing alternative strategies for avoidant coping, reducing negatively biased thinking, developing a realistic sense of safety, and revising the relationship with the lost person.

BEP-TG simultaneously targets separation and traumatic distress as well as other symptoms of PCBD, PTSD, and MDD.

Grieving allows us to heal, to remember with love rather than pain. It is a sorting process. One by one you let go of things that are gone, and you mourn for them. One by one you take hold of the things that have become part of who you are and build again. —Rachel Naomi Remen

Grief Counseling & Grief Therapy (Worden, 2018)

< 1 YEAR
Assume Health and Support
1. Listen
2. Build & maintain relationships
3. Educate (validate & normalize)
4. Case Management (connect with services, help with basic needs)
5. Teach self-regulation

> 1 YEAR
Helper more active
• All support functions
• Facilitate narrative (eulogy) paired with relaxed body
• Help create new relationship with deceased.

Tasks of Mourning (Worden, 2018)

1. Accept the Reality of the Loss
2. Process the Pain of Grief
3. Adjust to a World without the Deceased (Object)
   a. External Adjustments
   b. Internal Adjustments
   c. Spiritual Adjustments
4. Find an Enduring Connection with the Deceased in the midst of embarking on a New Life

Healing Trauma: Active Ingredients
(Gentry, Baranowsky & Rhoton, 2017)

- Therapeutic Relationship
- Relaxation/Self-Regulation
- Exposure
- Cognitive Restructuring/Psychoeducation

The Active Ingredients
Eric’s Hierarchy

CRITERION B
Exposure/Narrative
Relaxation & Self-regulation
Therapeutic Relationship & Positive Expectancy [Feedback Informed Treatment]
DISTRESS with LOSS and GRIEF

- Loss and Grief are perceived threats
  - Developmental history of painful past learning with loss and the experience of grief in our bodies
  - Remaining in the context of perceived threat without interrupting the physiological increase of energy and simultaneous progressive loss of neocortical functioning becomes involuntary mobilization (aggression/avoidance)
- The inability to navigate to perceived safety and/or intentionally interrupt the threat response somatically (INTEROCEPTION) or cognitively (NEUROCEPTION) will frequently result in involuntary immobilization
- These two outcomes explain the bipolar and biphasic nature of both PCBD and PTSD. Both with high levels of distress
  - Sustained threat response (SNS Dominance) = Distress

DESENSITIZATION ➔ EXTINCTION

- Reciprocal Inhibition
  - Sensory Experience (in vivo or witnessed) + PAIN/FEAR = similar sensory experiences becoming CS in the future
  - CR = FEAR/THREAT RESPONSE + TIME >> SNS Dominance (symptoms) and Compulsive Self-defense
  - PTSD = Perception of threat in the environment and memory where there is little or no danger
  - PCBD = Perception of threat in the body and memory where there is grief but no danger
  - No danger = No need for threat response
  - Interrupt threat response = confront scary environment (in vivo exposure), memory (imaginal exposure) and body (release involuntarily constricted muscles)
- CS + Relaxation = Desensitization + Repeat = Extinguish Distress

In vivo exposure + self-regulation as triage for Traumatic Grief Stabilization – Increased Functioning – Comfort – Sx Amelioration - Intentionality

Traumagenesis

Pairing Sensory Stimulus with Threat Response = Conditioned Stimulus

Essentially ALL trauma is associational learning

Distress in the present is the intrusion of painful sensory memories from the past that cause our bodies to go into a threat response
Reciprocal Inhibition
(Extinction)

CS + RELAXATION = Desensitization (extinction) of CR (ANX) + Multiple times = EXTINCTION of CR

GRIEF

...wants to be integrated and desensitized
...is a self-healing system at work
...is simple to resolve

Loss

Crescendo (usually tearfulness)

Desensitize

Recovery (loss accommodation - remembrance with love instead of pain)
Grief
Normal Mourning

Crescendo
(usually tearfulness)

Remembrance of the LOSS

Energy

Desensitize

Recovery
(remembrance with love instead of pain)

Complicated Bereavement & Mourning

- No Desensitization
- No Resolution
- Avoidance
- Bewilderment/
  Hopelessness
- Depression
- Suffering

Fear and muscle constriction

Symptoms

Loss

Energy

Crescendo
(usually)

No Desensitize

Recovery
(remembrance with love instead of pain)
INTEGRATION

TRAUMATIC GRIEF (Memory + Pain of Grief) is instinctually avoided by suppression, repression and/or dissociation.

INTEGRATION is completed by exposure + narration of the losses; remembrance; restoration of relationship; completing any tasks that may need done to restore honor.

NARRATIVE/EULOGY is an intentional language of the loss and the survivors experience with the loss and the grieving process.

PROBLEM to SOLUTION

RELAXATION
Remembrance of Loss + Relaxed Body = Desensitization and lessening of pain

NARRATIVE
Telling Story of Loss (Eulogy)+ Relaxed Body = Relegating Loss to the Past + Remembering with Love (instead of Pain)

Resolution
Re-starting and Completing Organic Grieving

Soften Muscles in Body
- Lower arousal
- Confronting pain
- Desensitizing fear
- Resolving grief

Crescendo
Fear and muscle constriction

Desensitize

Energy
Loss

Recovery
(remembering with love instead of pain)
Three Steps to Resolving Grief

1. Supportive Relationship (must have people who we can turn to in our pain and who can listen without anxiety)
2. Relaxed Body (regulation by softening muscles)
3. Telling our Story (Narrative IS integration and relegates loss to the past allowing us to remember with love)
4. Posttraumatic Growth

POSTTRAUMATIC GROWTH

What is posttraumatic growth?

It is positive change experienced as a result of the struggle with a major life crisis or a traumatic event.

POSTTRAUMATIC GROWTH IN CLINICAL PRACTICE

WHAT IS POSTTRAUMATIC GROWTH?

It is positive change experienced as a result of the struggle with a major life crisis or a traumatic event.
Posttraumatic Growth for Traumatic Grief
Dr. Tedeschi

New Opportunities

Greater Strength

Greater Appreciation

New Relationships

Spiritual Maturation

Calhoun, L. G., & Tedeschi, R. G. (2013)

POSTTRAUMATIC GROWTH MADE SIMPLE

RESULTS IN:

- Comfortable Body > Minimal Distress
- Increased Motor & Cognitive Capacity/Performance
- Intentional vs. Reactive Behavior
- Facilitates & Accelerates Posttraumatic Growth
