

Kuberre Systems Successfully Releases and Delivers version 4.4.0 of its Enterprise Data Management and Data Science Optimization Platform

Wilmington, MA- Kuberre Systems announces the successful release and delivery of its flagship EDM and Data Science Optimization Platform. Capital markets customers leverage the platform to harmonize and mobilize the internal and external data that drive operations through its EDM product. QTPy (*pronounced Cutie-Pie*), or Quantitative Techniques in Python, turbo charges data science/analytics teams with (1) a single/common set of APIs access all data, (2) the power of virtualized data for immediate model processing and (3) an enterprise-wide means of sharing/re-using model code.

“Releases 4.4.0 (EDM) and 2.2.0(QTPy) are exciting as it streamlines core aspects of our EDM – Data Governance, Data Lineage and management tools all the way through the data analytics optimization layer. These improvements are invaluable to our clients because they provide the immense flexibility that data analytics require while being enterprise compliant” said Kumar Metlapalli, Kuberre Systems Founder & CEO. Kumar went on to say, “We are the first vendor in the industry to deliver these capabilities at such a granular level. We are extremely pleased with the client feedback we received that has validated our strategic direction.”

The release is also exciting because it paves the way for specialized new service level offerings that address the concerns of a broader group of potential customers. Augmenting systems already in place within prospective clients, rather than requiring a full-scale replacement, the new services provide every firm the ability to enjoy our strongest capabilities immediately. Kuberre will be publishing news of just such a new service in the very near future.

About Kuberre Systems:

Kuberre Systems has been servicing capital markets firms for 20 years with a complete set of Enterprise Data Management, Data as a Service and Data Science/Analytics optimization solutions.
