

Data Governance-as-a-Service

Delivering Actionable Insights and Effective Compliance

Organisations today are faced with a wide range of data governance challenges, risks and opportunities. Getting it right is critical because now more than ever, data is money and taking control of this vital resource increasingly separates success from failure.

Effective data-driven business strategies need good governance. The problem is, most organisations struggle to exercise the control they are looking for, and their data governance strategies hit some critical and expensive roadblocks.

Data Governance Roadblocks

- Organisations decide they need to act on data governance, but don't know how
- They buy expensive data governance tools, but are unsure how to drive business value and outputs
- They want to run data governance in-house, but struggle with expertise and skill shortages

Effective data governance requires a transformational approach. Organisations should be freed from these restrictions so they can define, implement and evaluate a strategy that delivers actionable insights and effective compliance.

Data Governance-as-a-Service

Nephos has built a unique approach to delivering Data Governance-as-a-Service (DGaaS).

It is designed to meet a broad range of today's most important use cases, from creating a repository of all data assets for a centralised view of data governance, to building a risk profile and the ability to map governance to corporate risk.

Operationalises data governance, to take the burden off your team.

Delivers ubiquitous discovery and classification to take the guess work out of data governance.

Provides business insights and analytics to deliver actionable outputs for data governance.

Process Creation and Documentation

Data Governance As A Service

Discovery and Classification

Operationalise Data Governance

Business Intelligence for Data Governance

Discovery and Classification

In any successful data governance strategy, discovery and classification needs to be ubiquitous, and tools must be able to scan all data wherever it resides. This is a core part of any data project, because without accurate discovery and classification of data it is very difficult to implement and integrate any other upstream data services.

Operationalise Data Governance

Nephos enables organisations to operationalise data governance, giving them the ability to create and design the policies and processes they want to enforce rather than having to worry about how to deploy and manage them. This takes all the operational and expertise requirement overhead away from customers and leaves them free to focus on value creation.

Business Intelligence for Data Governance

Giving organisations the ability to take the raw outputs from the toolsets and turn them into tangible business outputs is the next phase in the evolution of data governance. Nephos DGaaS brings these capabilities together, allowing businesses to deliver on even the most ambitious data governance objectives.

Process Creation and Documentation

This provides customers with the integrated consultancy to help drive their ideas and objectives through to execution. For example, if an organisation needs to implement a data reduction project, Nephos works with them to understand what that entails, what people and processes are required, alongside the choice of technology tools to ensure success.

Additional Deliverables

Once stages 1-3 are carried out there is the opportunity for significant value to be added by addressing key issues such as Data Quality, Lineage, Encryption and Master Data Management.

Why Nephos DGaaS?

Nephos DGaaS enables organisations to plan, implement and deliver a data governance strategy focused more clearly on their key objectives.

Instead of hitting implementation roadblocks or experiencing the frustration of failed investments, data governance becomes part of a business toolkit that delivers effective compliance and actionable insights. What's more it is supported by our consultancy team to help you understand where to start, or support where you have started.
