UNIQUE DESIGN TRAITS

Bright electric color is a desirable shade for Paraíba & Paraíba-type tourmaline.

Incredibly rare, well cut and well saturated center stone, due to rarity of copper-bearing tourmaline inclusions can be expected, but stone still displays fine clarity and brilliance.

Melee around center stone from Brazil and down center spoke of the shank.

Hand-set precise French pavé in double halo and triple shank, with virtually no metal visible.

Winner of the 2018 "Top Rock" Award from WeddingWire.

GEMSTONE DETAILS

Cuprian Elbaite Tourmaline & Paraíba Tourmaline  
More often recognized by the name Paraíba, cuprian elbaite tourmaline is copper-bearing; as a trace element, copper is responsible for the intense neon blue hues that make Paraíba and Paraíba-type tourmalines so desirable. A stone is considered a Paraíba tourmaline if mined in the specific region in Paraíba, Brazil where the stone was first discovered in the 1980's. The allure of this magnificent stone from the moment of its discovery saw demand far surpass supply. Thanks to more recent discoveries of deposits in Nigeria and Mozambique supply has increased for this unique stone, but fine material over a carat remains extremely rare. Stones mined in Mozambique, Nigeria or anywhere else in the world besides Paraíba are thus referred to as Paraíba-type tourmalines. From the moment this stone was discovered, its unique color captivated gem collectors and jewelry lovers around the world. Demand has remained high with the addition of new sources; no other color tourmaline has ever commanded the prices of fine cuprian elbaite tourmaline. The range of color in the stone can appear greenish blue, bluish green, green, blue and violet. Color is perhaps the most important variable when comparing these stones, all other things being equal. Inclusions are to be expected and forgiven when judging fine stones, as long as saturation of color and brightness remain strong.

Comments:

General Report Comments:

Document No: 1090714      Validation Date: 22 February 2018

Identification  
 Mineral Type: Natural Tourmaline      Color Description: Blue - Green  
 Variety: Paraiba-Type

Carat Weight: 4.17 cts      Shape: Pear  
 Measurements: 11.92 x 7.88 x 7.38 mm      Cutting Style: Modified Brilliant Cut

Comments: Paraiba-Type is a term/color variety applied by the AGL to the copper-bearing variety of elbaite tourmaline, which was first discovered in the Paraiba state of Brazil, but may have originated from a different source.

Origin  
 Provenance: Mozambique

Comments: Based on available geological information, it is the opinion of the Laboratory that the origin of this material would be classified as Mozambique.

Enhancement  
 Standard: See comments      Additional: None  
 Stability Index: Color Stability: Excellent

Comments: This color variety of tourmaline is commonly the result of a relatively low temperature heating process.

**American Gemological Laboratories™**  
 America's first and most highly respected origin lab.

Founded in 1977,  
 AGL is an internationally recognized gemstone testing facility, specializing in comprehensive colored stone analyses.

AGL has the distinction of being the first laboratory in the United States to issue Country-of-Origin reports. Our company and its principals have a long tradition of research into the detection of and reporting on gem identification-and-classification, gemstone treatments and provenance determinations.

Our staff is composed of experts in the field of gemstone testing and reporting. Our findings reflect the latest knowledge and analytical techniques to ensure the highest standards are applied on every stone we test.

AGL's testing and reporting methodology provide you with unsurpassed quality and reliability. We are committed to providing the highest level of service and reporting that our clients and the industry have come to expect from the AGL.
