## NTC Type SP Series Ultra-stable Probe Thermistors

The NTC Type SP60, SP65, SP85, and SP100 Ultra-stable Probe Thermistors have similar construction and dimensions to the Type P60, P65, P85, and P100 Probe Thermistors. Ultra-stable Probe Thermistors receive additional processing to assure their continuous use in one of three temperature classes and are categorized into one of six stability groups.

## Applications

The NTC Type SP60, SP65, SP85, and SP100 Ultrastable Probe Thermistors may be used in all temperature measurement and control applications with the added assurance of long term stability and reliability. They are the ideal choice for use as secondary standards in laboratories.

## Data

The temperature class represents the maximum permissible continuous operating or storage temperature available. The stability group represents the maximum drift rate, in percent resistance change per year, of the thermistor, when operated or stored at all temperatures up to the maximum rating. Ultrastable Probe Thermistors should not be exposed to temperatures higher than the maximum rating, as this will degrade their stability and void the stability classification. When specified, additional preconditioning can be preformed to stabilize units for a particular application.

## Stability Classes (By Nominal Resistance at $77^{\circ} \mathrm{F}\left(25^{\circ} \mathrm{C}\right)$

Ultra-stable probe thermistors availability depends upon nominal resistance at $77^{\circ} \mathrm{F}\left(25^{\circ} \mathrm{C}\right)$. Stability class is indicated by a code letter for temperature class and a code number for stability group.

Example: "A1" $=.02 \%$ maximum change per year at $221^{\circ} \mathrm{F}\left(105^{\circ} \mathrm{C}\right)$ maximum temperature.

## Ordering Information

The code number to be ordered may be specified as follows:

*Special tolerances are available on request. Consult the factory for special resistance tolerances, non-standard resistances and/or nonstandard temperatures.
${ }^{* *}$ The zero-power resistance at $77^{\circ} \mathrm{F}\left(25^{\circ} \mathrm{C}\right)$, expressed in ohms, is identified by a three digit code number. The first two digits represent significant figures, and the last digit specifies the number of zeros to follow. Example: 2k Ohms ="202". The standard resistance values are from the 24-Value series decade as specified in Military Standard MS90178. 1.0/1.1/1.2/1.3/1.5/1.6/1.8/2.0/2.2 / 2.4 / 2.7 / 3.03 .3 / 3.6 / 3.9 / 4.3 / 4.7 / $5.1 / 5.6$ / 6.2 / 6.8 / 7.5 / 8.2 / 9.1
